

SOME HELP FOR VIEWING THE R&P VIDEOS

*If you have a fast modem (internet connection speed), then you should be able to buffer the video quickly.

*The video has to buffer before it is able to play fully and completely.

*The video is able to buffer at the same time it is playing so changing the setup could help

- 1.) Open your windows media player
- 2.) Go the library button (don't click) click on the little arrow button underneath it, which will reveal a list (such as create playlist and such), look for the more options and click.
- 3.) Go to the tab labeled Performance and then make sure the Video Acceleration is up to 100 percent. Don't use the default buffering, instead use the other buffer options, and place 30 instead. That means there will automatically be thirty seconds buffered.

A larger number will provide smoother playback but a longer wait for content to load. A smaller number will provide quicker initial playback with the risk of short buffer periods during play
